

## Course 2024-25

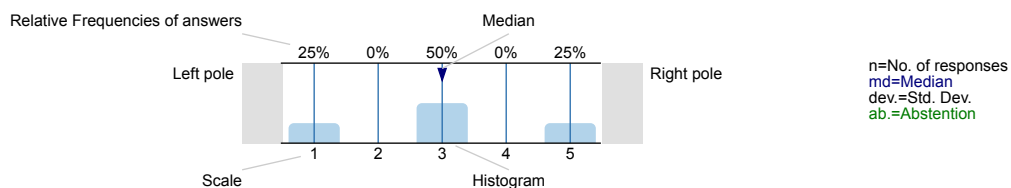

ENG5337 Advanced Artificial Intelligence and Machine Learning 5 (ENG5337-1(24/25))  
No. of responses = 12 (16.7%)

## Survey Results

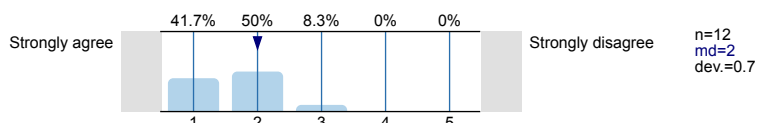

## Legend

Question text

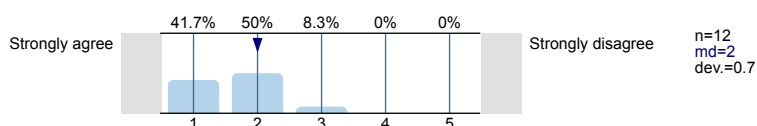

## 1. Teaching and course quality

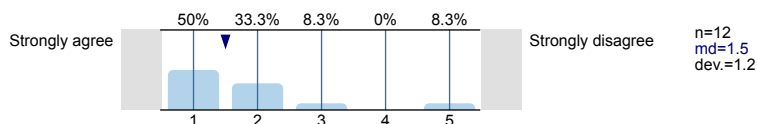

1.1) The lecturer explained things well

1.2) The course was intellectually stimulating

1.3) I am satisfied with the overall quality of the course

# Profile

## 2. Open Questions

2.1) What is good about this course?

- Having an assignment based course is good.
- i have to say teacher's notebook were orgnized very nice and easy to learning.
- Khiem is a brilliant lecturer and really takes the time to make sure students understand content. Katy was also very good at lecturing, but did sometimes seem unsure about the content. Some of the assignments were fun and it was great to put what we have learnt into practise. The moodle quizzes were good and enjoyable yet challenging.
- Overall really enjoyed the course except the group project.
- Khiem teaches very well. I really like the way he delivers his lessons and shares his knowledge. He is very responsive and attentive to his students in this class. He also puts in extra effort to help students understand the material, such as holding online classes on weekends and providing recordings for topics that couldn't be covered in class. In my opinion, he is the best lecturer among all the classes I have taken. I believe Khiem can be a benchmark for other lecturers.
- No exams ??
- Practical assignment to reinforce knowledge.  
Extremally clear lecture for neural network part.  
A lecture given by a guest professor, which really inspires new ideas and awareness.
- project interesting.  
kind supervisor
- Teachers were helpful and proper guidance was given throught out the course
- teacher teaches good
- Teaching about the advanced artificial intelligence models has been a plus point for this course and in depth usage of the knowledge gained through projects and assignment has made this more valuable for students with no prior knowledge to this course
- The course has many lab that stimulates the motivation for learning
- The jupyter notebooks that we received were very well put together and quite extensive. These were the main source of information, at least for me. Additionally the lecturers were very much interacting with the students - I received incredibly exhaustive answers to my emails within a day at max -> especially from Khiem (he's always very exhaustive), but from Katy as well. The number of lab hours was also fitting, as I think we need as many sessions as we had simply due to the amount of stuff that is packed into the course. The lectures themselves were also well put together, good to listen to and engaging (sweets - way to go).

2.2) How could this course be improved?

- all good
- Assignment timings
- Changing the group project to an individual one as both are same and in group project, the contribution of teammates is the crucial part in a team project and if the team doesn't support all of the works goes to one person..
- I believe the main point would be giving us more time for the group project. As you could clearly see, many of the group solutions presented at the end of the course were either incomplete or not as developed as the groups would have liked, simply due to time constraints. 2 weeks for the groups that had their first lab session in the latter week is simply not enough. Also with that - I believe it would be more "fair" (?) if both cohorts for the group projects had their first lab sessions in the same week, perhaps a day after each other. I know that we were meant to get in touch with our group members before the first session, but in practice, many people just wouldn't respond to the messages. Having the first lab session almost a week later, I believe the groups in the first cohort had a bit of a headstart. Additionally, I think it would be very much beneficial for students to have a more well-defined tasks and marking schemes for those tasks. I know this is the first year this course is held and Katy explained that she purposefully kept the tasks pretty vague to see what we come up with, but it is a little bit disappointing to get an 11.5/20 from the individual project when you thought you did everything as asked. I get that it stems from the fact that other students must have simply done a better job cause the grading is for sure normalized, but still - more clearer marking scheme would be nice I think. Also the time slots for the lectures. I mean, 2h sessions on Friday afternoon packed with concepts that are quite difficult to follow on first try does not make things easy :) And also for some equations on the slides, I think it would be nice to have the symbols explained more often. Like what is P, A, S etc. for RL for example - during the lecture I was getting lost in the formulas sometimes. I also understand that the lectures with industry people are important and thought-provoking (I especially liked the one on the environmental impact of AI), but with how much stuff was packed into the lectures and also the fact that we were running behind with Khiem's lectures already in week 2, perhaps some of these slots should have been allocated to getting back on track with the lecture material? I know it's probably unrealistic but that's just the feeling I had.
- I hope RL part could have better slides. It is tough to read through loads of letters.
- Lot of time for the lectures as one of my lecturers didn't get enough time not that the lecturer mistakes he given short time and given an larger task

- Make the explanation more detailed and profound.
- maybe leave more time for group project part and expand some LLM content
- More Practical Demonstration
- None
- The amount of content delivered was too much and it felt like the course could have been planned better to make better use of the time available - too much content in a short time, with hours of extra content uploaded via video which made me feel quite overwhelmed.

The lecture slot 3-5pm on a Friday was very intense and students were very disengaged.

Khiems assignments were fun but should be worth more than 15% for 3 tasks that took a long time to do.  
Katy's individual assignment was really fun and fair workload for 15%.

The group project was a bit of a disaster. If it had been given earlier it would have been a really fun project, but 3 weeks to complete a project with people you don't know, with different timetables, at the end of the semester, worth 30% is ridiculous.  
Very poor communication within the group, group members frequently communicating in a different language and adding comments to the code in a different language which made it difficult to contribute. Very overwhelming, felt rushed, even an extra week would make a huge difference. I would not be surprised if this was the general feedback about the group project from across the class, as many of my peers have shared similar negative views on the project.  
Lab demonstrators also seemed very unsure at the tutorial sessions for the group project.

I think 30% for a group project is too much. Also teams of 5/6 was very difficult to organise and distribute work evenly. If the project could be simplified and working smaller groups I think it would be a more beneficial task.  
Course would be improved if Khiem's assignments were worth 25%, and the group project worth 20%.

I know this is the first year of the course, but I hope these points are considered for next year.

- We need more time for the Quanser project.
